

## Dating recommendations using Spark

Felipe Chamma, Felipe Formenti, Ryan Speed

#### Agenda

- 1 The problem
- 2 Data set description
- 3 Predicting Ratings
- 4 The love\_score<sup>TM</sup> feature
- 5 JSON data output

#### 1 - The problem

- Czech dating website
- Improve matchmaking
- Improve scalability
- Test Spark for real

## Data set description

## 168,791 users User\_id, gender

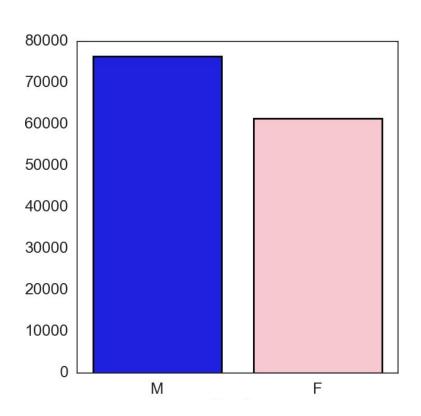

## 17,359,346 ratings User\_id\_1, user\_id\_2, rating (0-10)

**0.06%** Matrix sparsity

#### Count by gender

 Males are the majority, after cleaning data for unknowns (which was allowed back in 2006)

#### Ratings by gender

	Total Ratings	Mean	SD
F-M	7.10 M	6.92	2.74
M-F	3.23 M	5.48	3.12
F-F	1.24 M	5.14	3.21
M-M	683 k	4.46	3.32

#### Ratings by gender

M-F

250000

300000

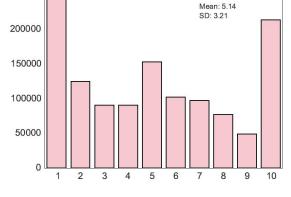

200000

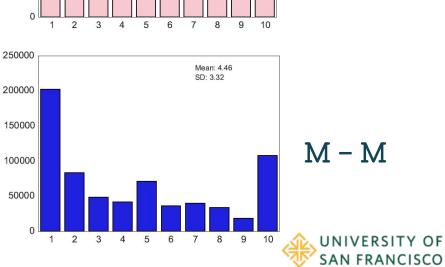

100000

3

5 6

8 9

F - F

### Predicting Ratings

#### Splitting users into gender/preference matrices

Male - Female

Female - Male

Items

Jsers

Items

	1	2	3		N
1				•••	
2					
3				•••	
				•••	
N					

	1	2	3		N
1				•••	
2					
3					
•••					
N					

#### Collaborative filtering methods

#### UV decomposition

- Good approach if appropriate k is chosen
- Much faster

#### Similarity matrix

Would take forever

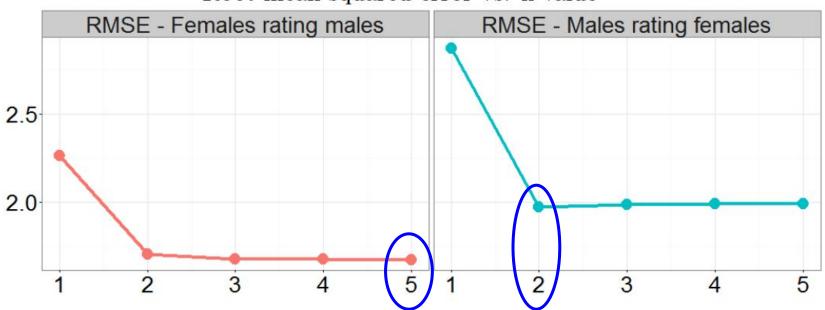

#### UV Matrix Decomposition

Users

#### Matrix decomposition

Root mean squared error vs. k value

# The love\_score<sup>TM</sup> feature

#### The metric

$$love\_score\left(U_i, U_j\right) = \lambda_1 \left(10 - |Att(U_i) - Att(U_j)|\right) + \lambda_2 Pref(U_i, U_j) + \lambda_3 Pref(U_j, U_i)$$

$$Pref(U_i, U_j) = \hat{f}(U_i, U_j) - \overline{U_{iG}}$$

$$\hat{f}(U_i, U_j)$$
: predicted rating of user j by user i

#### 5 - JSON data output

- Using Flask app running on EC2 server
- Data stored in Amazon RDS (postgreSQL)
- Request of recommendations by user\_id: <u>http://ec2-52-87-166-242.compute-1.</u> amazonaws.com:5000/id/8

#### How it looks
